Claims As Amended

1-2. (Canceled)

3. (Previously Presented) An apparatus for storing electronic money,

comprising:

a radio signal receiving block for receiving a radio signal and determining

whether the received signal corresponds to a general information or balance

storing information;

a memory block for storing a storing amount, a content and a certification

information;

a computation logic block for comparing a serial number extracted from

the received signal with a previously stored serial number if it is determined that

the received signal corresponds to balance storing information, and storing a

balance storing data extracted from the balance storing information into the

memory block if the extracted serial number and the previously stored serial

number are determined to be the same and the balance storing information

transmitted from the radio signal receiving block is determined to be a proper

signal; and

a non-contact block for storing a balance storing amount into the memory

block using a card storing unit and reading a balance storing amount of the

memory block when paying the money.

Art Unit 3624

Page 3

Attorney Docket No. 0630-0913P

Reply to Office Action dated March 11, 2005

4. (Previously Presented) The apparatus of claim 3, wherein said computation logic block is designed so that a certain amount of data is stored into the memory block only when first and second balance storing information are all received from the radio signal receiving block.

5. (Previously Presented) The apparatus of claim 3, wherein said radio

signal receiving block includes:

a key input unit for inputting a certain key signal;

a display unit for displaying general information or balance storing

information as a character or digit;

a control means for decrypting an output signal of the high frequency

processing unit, transmitting to the display unit, transmitting to the

computation block if the information is balance storing information or is a

balance storing content check key signal from the key input unit, receiving a

balance storing content information and displaying the same on the display unit;

and

a tone signal generator for generating a call sound or an error sound

during the balance storing operation by the control means.

6. (Previously Presented) The apparatus of claim 5, wherein said

control means is designed to check whether there is a certain pattern signal in

Art Unit 3624

Page 4

Attorney Docket No. 0630-0913P

Reply to Office Action dated March 11, 2005

an output signal of the high frequency processing unit, determine whether the

information corresponds to a common radio information or a balance storing

information, format the information into a certain format corresponding to the

computation logic block when there is a certain pattern signal, determine

whether there is an error signal, and transmit the formatted information to the

computation logic block when there is no transmission error.

7. (Previously Presented) The apparatus of claim 3, wherein said non-

contact block includes:

a modulation and demodulation unit for preparing a signal transmitting

and receiving operation with a card storing unit or a card reader; and

a non-contact computation unit for storing balance storing data into the

memory block at the modulation and demodulation unit if the received signal

corresponds to balance storing information, reading the balance storing data

stored in the memory block if money is paid and transmitting the read data to

the modulation and demodulation.

8. (Previously Presented) The apparatus of claim 3, wherein said

computation logic block includes:

control means for summing the balance of the memory block and the

balance storing amount if certification information is extracted during the

Application No.: 09/299,596 Art Unit 3624

Attorney Docket No. 0630-0913P Reply to Office Action dated March 11, 2005

Page 5

balance storing operation and the previously stored various certification

information is the same as the extracted certification information, for thereby

determining whether a subscriber is a proper subscriber, storing the balance

storing data into the memory block when a summed amount is below a certain

amount and transmitting data to a radio signal receiving block in order to

generate an error and error sound when the summed amount exceeds the

certain amount; and

a radio interface unit for implementing a data transmitting and receiving

operation between the radio signal receiving block and the control means.

9. (Previously Presented) The apparatus of claim 8, wherein said

control means is designed to decrypt an output signal of the radio signal

receiving block, extract certification information if there is a service stop signal,

disables the memory block when the extracted certification information is the

same as the previously stored certification information, and stop the service of

the card.

10. (Previously Presented) An apparatus for storing an electronic money,

comprising:

Application No.: 09/299,596 Attorney Docket No. 0630-0913P

Art Unit 3624 Reply to Office Action dated March 11, 2005

Page 6

a radio signal receiving block for receiving a radio signal, determining

whether the received radio signal corresponds to general information or balance

storing information;

a memory block for storing a storing amount, a content, and certification

information;

a modulation and demodulation unit for implementing a signal

transmitting and receiving operation with a card storing unit; and

a computation logic block for comparing a serial number extracted from

the received signal with a previously stored serial number if it is determined that

the received signal corresponds to balance storing information, and storing the

balance storing information into the memory block if the extracted serial number

and the previously stored serial number are determined to be the same and the

various certification information extracted from a the balance storing information

transmitted from the radio signal receiving block during the balance storing

operation are determined to be proper information, storing the balance storing

data of the modulation and demodulation unit into the memory block and

reading the amount data up to the amount confirmed by the modulation and

demodulation unit during the payment operation from the memory block and

paying via the modulation and demodulation unit.

Application No.: 09/299,596 Attorney Docket No. 0630-0913P

Art Unit 3624 Reply to Office Action dated March 11, 2005

Page 7

11. (Previously Presented) The apparatus of claim 10, wherein said

computation logic block is designed to receive first and second balance storing

information from the radio signal receiving block and store the amount data into

the memory block only when the balance storing information is determined to be

proper information.

12. (Previously Presented) The apparatus of claim 10, wherein said

computation logic block is designed to stop the service of the terminal when

proper first balance storing information is received from the radio signal

receiving block.

13. (Previously Presented) The apparatus of claim 12, wherein said

computation logic block is designed to release a temporary service stop state of

the terminal when balance storing cancellation information is received from the

radio signal receiving block during the balance storing operation.

14. (Previously Presented) The apparatus of claim 10, wherein said

computation logic block includes:

control means for decrypting balance storing information based on a radio

transmission method, storing the balance storing data into the memory block if

the subscriber is determined to be a proper subscriber, storing the balance

storing data based on a non-contact method, reading the amount data up to the

amount confirmed during the payment and transmitting via the non-contact

interface unit;

a radio interface unit for implementing a data transmitting and receiving

operation with the control means; and

a non-contact interface unit for implementing a signal transmitting and

receiving operation between the modulation and demodulation unit and the

control means.

15. (Previously Presented) The apparatus of claim 14, wherein said

control means is designed to disable the operation of the memory block if an

output signal from the radio signal receiving block is determined to be a proper

service stop signal, and stop the operation of the modulation and demodulation

unit for thereby stopping the service of the card.

16. (Previously Presented) An apparatus for storing electronic money

wherein the apparatus is engaged with a portable terminal and an electronic

money card, comprising:

high frequency processing means for receiving a radio signal and

converting the received radio signal into a digital signal;

Application No.: 09/299,596 Attorney Docket No. 0630-0913P Reply to Office Action dated March 11, 2005

Art Unit 3624

Page 9

modulation and demodulation means for implementing a signal

transmitting and receiving operation with a card storing unit or a card reader;

a memory block for storing a storing amount, a content and certification

information; and

control means for receiving an output signal from the high frequency

processing means, judging whether output signal corresponds to a general

information or a balance storing information, storing the balance storing data

into the memory block when a serial number extracted from the radio signal and

the previously stored serial number are determined to be the same and various

certification information extracted from the amount information are determined

to be the same as previously stored various certification information if the

received signal contains balance storing information, checking the balance

storing data inputted from the modulation and demodulation means, storing the

amount into the memory block, reading an amount of money up to an amount

confirmed by the modulation and demodulation during the payment operation

and then paying the money.

(Currently Amended) A method for storing electronic money using a 17.

radio communication and a card storing unit, comprising:

providing a device for automatically determining whether a received radio

signal corresponds to balance storing information;

Attorney Docket No. 0630-0913P

Art Unit 3624 Page 10

Reply to Office Action dated March 11, 2005

extracting various certification information including amount information

and a radio receiving block serial number if the received radio signal is

determined to correspond to balance storing information, and determining

whether the extracted serial number is the same as a previously stored serial

number and whether a subscriber is a proper subscriber; and

storing the amount information extracted from the balance storing

information if the extracted serial number and the previously stored serial

number are determined to be the same and the subscriber is determined to be a

proper subscriber.

18. (Previously Presented) The method of claim 17, wherein in said step

for determining the balance storing information, the information is determined to

be a balance storing information when there is a certain pattern signal in the

received radio signal.

19. (Previously Presented) The method of claim 17, wherein said step for

extracting various certification information includes:

reading a counter value contained in the balance storing information if it is

determined that the serial numbers are the same and determining whether the

read counter value is the same as a counter value of a function for the previously

stored encryption;

Attorney Docket No. 0630-0913P Reply to Office Action dated March 11, 2005

Art Unit 3624

Page 11

determining whether the serial key value outputted via the encryption

process in which the counter values are coincided is the same as a previously

stored key value; and

determining that a subscriber is a proper subscriber when the key values

are the same.

20. (Previously Presented) The method of claim 19, wherein said

decryption process of the balance storing information is implemented when the

counter value extracted from the balance storing information is the same as the

counter value for the previously stored decryption.

21. (Previously Presented) The method of claim 17, wherein said step for

storing the amount information includes:

summing a current balance storing amount and a recent radio balance

storing amount to obtain a first summed amount if the subscriber is a proper

subscriber and determining whether the first summed amount is below a certain

amount;

determining whether the first summed amount equal to a second summed

amount contained in the balance storing information based on the radio

transmission method if the first summed amount is below a the certain amount;

Attorney Docket No. 0630-0913P

Art Unit 3624

Page 12

Reply to Office Action dated March 11, 2005

storing the balance storing data if the first summed amount is equal to the

second summed amount; and

determining the signal as a balance storing error if the first summed

amount is greater than a the certain amount or the first summed amount is not

equal to the second summed amount.

22. (Original) The method of claim 17, further comprising a step for

displaying the current storing amount and the storing amount contents when

the balance storing data is stored.

23. (Previously Presented) A method for storing electronic money by

changing information in an electronic money card based on a radio

communication, comprising:

determining whether a card service stop or release information is received

if there is no balance storing information;

extracting a certification information and determining whether the

extracted certification information is the same as previously stored certification

information when it is determined that the card service stop or release

information is received; and

releasing a card service stop if the extracted certification information is

the same as the previously stored certification information.

Application No.: 09/299,596 Attorney Docket No. 0630-0913P
Art Unit 3624 Reply to Office Action dated March 11, 2005

Page 13

24. (Previously Presented) The method of claim 23, wherein said certification information is a certain variable transmitted from the radio communication service provider.

- 25. (Original) The method of claim 24, wherein said variable is a serial number of the radio signal receiving block.
- 26. (Previously Presented) A method for storing electronic money using radio communication and a storing unit, comprising:

determining whether a received radio signal corresponds to personal information update information;

extracting a certain variable if it is determined that the received radio signal corresponds to personal information update information;

comparing the extracted variable with a certain variable transmitted during a previous personal information update; and

updating personal information when the currently transmitted variable is greater than the previously transmitted variable.

27. (Currently Amended) A method for storing electronic money using radio communication and a storing unit, comprising:

Art Unit 3624

Page 14

Attorney Docket No. 0630-0913P

Reply to Office Action dated March 11, 2005

determining whether received balance storing information corresponds to

a first balance storing information;

determining whether the received balance storing information is a proper

signal by performing a certification of the first balance storing information if it is

determined that the received balance storing information corresponds to the first

balance storing information;

setting a temporary service stop state if it is determined that the received

balance storing information is a proper signal and waiting to receive second

balance storing information;

performing a certification of the second balance storing information when

the second balance storing information is received and determining whether the

second balance storing information is a proper signal;

wherein said certification step includes:

extracting the storing request amount from the first balance storing

information, summing the thusly extracted amount and the balance, and

determining whether the summed amount is greater than the storing limit

amount;

encrypting the value as a certain key value when the summed amount is

the same or is smaller than the storing limit amount and determining whether

the value equals the value extracted from the first balance storing information,

said certain key value is provided from a second certification and not from a

Application No.: 09/299,596 Attorney Docket No. 0630-0913P
Art Unit 3624 Reply to Office Action dated March 11, 2005

Page 15

radio communication service provider and said certain key value is previously stored; and

when the encrypted value is equal to the extracted value and changing to a decimal value and displaying the decimal value;

formatting the data contained in the second balance storing information and encrypting using a certain key value of the certification provider;

determining whether the encrypted value is equal to an encrypted value contained in the second balance storing information; and

determining that the signal is a proper signal if the encrypted values are equal;

wherein said encryption step is performed using a certain key value provided from the first and second certification providers;

storing a request amount if it is determined that the second balance storing information is a proper signal and implementing an available state of the card; and

completing balance storing operation when proper balance storing cancellation information is received after the first balance storing information is received.

28-33. (Canceled)
